An investment in your employees always means an investment in the future

Know-How is the way to success

Progressive technology requires sound knowledge

The pressure on maintenance engineers and other technical employees to improve their performance continuously has never been so high as today: new processes and technologies are introduced in automated production in ever shorter production cycles.

As a reliable supplier of production machines and systems and a long-standing partner of the automobile industry, Emhart Teknologies has recognized that in addition to machine and systems supply there is a need for professional and future-oriented training possibilities in such an innovative and performance-oriented environment.

For this reason a modern training center has been built on the company premises of Emhart Teknologies in Giessen, Germany, where all the equipment necessary to run optimum customer-oriented training schedules are provided:

Seminar rooms and technical equipment

2 seminar rooms

for lectures in theory (42 square meters each)

1 workshop

for practical training (30 square meters)

All rooms are fully air-conditioned and equipped with machines and computers exclusively for training purposes.

A large number of training machines, computers and materials have been developed on the basis of many years of experience in maintenance and customer service and are now ready for use. They guarantee a purposeful and convincing know-how transfer in theory and practice.

From practice to theory and back to practice again

The central theme of our training concept is the daily requirements of automobile production

Nobody knows the essential requirements during commissioning and maintenance work better than our service technicians at Emhart Teknologies.

This is used to your benefit: all our training seminars are given by expert tutors with many years of experience in industry.

Tailor-made training for optimum deployment of production equipment

In a synthesis of theory and practice the participants learn everything they require to be optimally prepared for their future tasks in the shortest possible time.

Only the trained employee is able to understand the complex systems in the automobile production and to react in a correct and purposeful way when malfunctions occur.

And only due to the interaction of trained operating staff and the perfected Emhart technology are low failure rates and a high availability of production equipment made possible.

Emhart Teknologies project managers individually adjust the training course to suit the requirements given by the new technology of your machines and equipment.

On the basis of this information the tutors will then adjust the content of the course to meet the system requirements given, i.e. product, plant equipment, scope of supply and configuration.

In the same way the demands of different specialist personnel will be considered in detail. For example, training courses are specially designed for electrical and mechanical engineers or product line operating personnel and includes the expert knowledge that is to be completed or extended.

This way training for the handling of future technical tasks and processes is individualized. The result of this intensive preparation is:

100% benefit from each training course for the application in daily production.

As much theory as necessary — as much practical training as possible

Meet the challenges of new technologies and processes with optimal training

The participants learn the necessary specialist knowledge and skills in fully air-conditioned seminar rooms equipped with state-of-the-art presentation technology, however:

We are able to memorize only 10% of everything we read. We are able to memorize only 50% of everything we see and hear. But we are able to memorize 90% of everything we put in practice.

That's why the main emphasis of our training lies on practical training directly on the machine

A high percentage of practical training in small groups is the best way to memorize knowledge.

In contrast to the operation in the production line, the employee has the possibility to try out the machines without undue caution.

This enables us to simulate the complete range of failures and defects that can occur in every-day production. Machines will be prepared with 'defects' and the defects will be removed. The employees can practice how to detect and subsequently repair defective machines without being under the pressure of the demands of production and they also receive a comprehensive insight into current technology.

Emhart Teknologies training center - in brief

Size of training groups a maximum of 8 participants

Equipment air-conditioning, individual training work places

for programming exercises, network software,

training machines

Presentation technology smart boards, video / data projectors, flip charts,

overhead projectors

Training topics TUCKER stud welding systems, TUCKER-Weldfast,

TUCKER hole stud welding, TUCKER self-piercing riveting,

Plastifast, Plasti-Kwick, Popmatic
